Project Executable Files

This section requires submission of all executable and deployable files for your project. Ensure all files are properly organized, named, and uploaded to the specified submission platform. The evaluator must be able to run or deploy your solution using the provided files and instructions.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	Yes (Local JSON storage template schema)
5	Environment configuration file (.env.example or similar)	Yes
6	Deployed application URL (if hosted)	NA (Configured for Local Host Evaluation)
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA

8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes (<i>Includes pytest functional test suite</i>)
10	Demo video or walkthrough (if required)	Yes (<i>Link attached below</i>)

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	NA (Fully optimized for local development environment review)
Login Credentials (Demo)	No authentication required (Open-access local execution sandbox)
Platform / Hosting Provider	Local Virtual Machine Execution Environment (Python Runtime)
Repository Link	https://github.com/Me-gha-na-7/personalized-networking-assistant
Demo Video Link	https://youtu.be/NPYMMxekIOQ?si=uSqUHR5VrqK40HAv

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

- **Pre-requisites:** Python 3.10 or higher, pip package manager, and git version control tool installed.
- **Step 1 (Clone Repository):** Open your terminal and run:
git clone https://github.com/Me-gha-na-7/personalized-networking-assistant.git
- **Step 2 (Environment Activation):** Move into the root directory and activate your virtual environment:
(Set-ExecutionPolicy -Scope Process -ExecutionPolicy RemoteSigned) ; (& .\env\Scripts\Activate.ps1)
- **Step 3 (Install Dependencies):** Install required system packages:
pip install -r requirements.txt
- **Step 4 (Launch Backend API):** Start the core FastAPI server:
uvicorn backend.app:app --reload
- **Step 5 (Launch Frontend UI):** Open a second terminal window (with active venv) and start the interface:
streamlit run frontend/main.py
- **Step 6 (Access the Application):** Open your preferred web browser and navigate to:
http://localhost:8501

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	First inference lag on cold startup	Status: Resolved. The local deep learning text engine caches weights locally on its initial execution loop to accelerate subsequent prompt deliveries.
2	Parallel execution bottleneck under high strain	Workaround. Asynchronous handlers are built directly into our paths using async def configurations to handle multi-client queues without throwing timeouts.
3	Transient network dependency errors	Workaround. Integrated strict try-except wrappers inside our API service connection block to maintain stability if an external API lookup times out.
